THIRD-PARTY VERIFIED

IMPORTANT NOTICE

# For Research and Education.

*Read this before turning the page.*

All content in this guide is provided for **research and educational purposes only**. Greenstone products are sold for **in-vitro research and laboratory use**.

Nothing in this guide constitutes medical advice, diagnosis, or treatment. **Consult a licensed physician** before making any health decisions or before introducing any new compound into a personal wellness protocol.

Statements made in this publication have **not been evaluated by the U.S. Food and Drug Administration**. The compounds and products discussed are **not intended to diagnose, treat, cure, or prevent any disease**.

> **What this guide is.** A structured, plain-language overview of how the research community thinks about starting points, safety, and self-tracking when working with peptides.
>
> **What this guide is not.** A prescription, a dosing chart, or a clinical protocol. Any reference to amounts, frequencies, or "common approaches" reflects the published research record — not a recommendation for personal use.

CONTENTS

# What's Inside.

*Eight chapters. One clean path from curiosity to clarity.*

00 A Letter from the Greenstone Team 004
Why we made this guide and how to use it.

01 Start Smart 005
What peptides are — and how to avoid early missteps.

02 Safety First 007
The non-negotiable risk-reduction checklist.

03 Pick the Right Peptide for Your Goal 009
A clean decision framework — no guesswork, no hype.

04 The First 72 Hours 011
Set up, start clean, build early momentum.

05 Track What Matters 013
Turn "I think it's working" into measurable progress.

06 Make Results Stick 015
A 30-day routine that compounds, not complicates.

07 Your Next 3 Steps 017
The action plan you can run starting today.

WELCOME

# Clarity beats complexity.

*A note from the Greenstone team.*

If you've made it to this page, you're already further along than most. The peptide space is loud, fragmented, and full of advice that ranges from sound science to outright fiction. We built this guide for the curious — for the person who wants to understand what peptides are, how the research community thinks about safe starting points, and what to actually *track* across an honest 72-hour window.

You won't find aggressive promises here. You won't find a 90-day transformation challenge, a hype protocol, or a single "magic" molecule. What you will find is a calm, structured walk-through: what peptides are, how to think about goals, how to read your own signals, and how to build a routine that actually holds when life gets busy.

Greenstone exists because we were tired of the gray market. Every batch we sell is **third-party verified**, manufactured to research-grade purity, and shipped from the United States. That's the bar. This guide is one small extension of that commitment — research, plainly written, without pretending to be your physician.

One last thing before you turn the page. **Peptides are tools, not shortcuts.** The people who get the most from them are the ones who pair them with the basics — sleep, protein, training, and consistency. If that sounds boring, good. The boring stuff is where the compounding lives.

*— The Greenstone Team*

MIAMI · RESEARCH-GRADE · THIRD-PARTY VERIFIED

CHAPTER

# 01

## Start Smart.
## *Know what peptides are (and skip the costly missteps).*

- What peptides actually are at the molecular level
- The four red flags beginners almost always miss
- How to anchor everything to a single, clear goal

CHAPTER ONE

# What peptides actually are.

*A 90-second primer before you make any decisions.*

Peptides are short chains of amino acids — smaller than proteins, larger than single amino acids. They function as **signaling molecules** in the body, carrying instructions between cells. The research community studies them across categories that include repair and recovery, metabolic signaling, cognitive function, and skin biology. They are not supplements. They are not pharmaceuticals in the traditional sense. They are messengers.

> RESEARCH NOTE
>
> Many users report subtle early signals — better sleep continuity, slightly less soreness, steadier appetite — within the first week of consistent use. Visible changes in body composition or skin typically take weeks, not days. Pattern recognition matters more than any single data point.

## The four mistakes beginners make.

Almost every problem we see comes back to one of four assumptions. Read these slowly.

> AVOID THESE FOUR
>
> - ✓ **"More is better."** Higher amounts do not equal faster results in the research record. They do raise risk.
> - ✓ **Stacking too early.** Combining multiple peptides at the start makes it impossible to read what's actually working.
> - ✓ **Copying influencers.** Their body, their context, their goals. Not yours.
> - ✓ **Ignoring contraindications.** Pre-existing conditions, medications, and life stages all change the calculus.

## Choose your goal first.

Pick **one** reason for exploring peptides — better sleep, faster recovery, metabolic support, healthier skin, or tissue repair. One goal makes everything else simpler. It tells you which peptide family to look at, which metrics to track, and what "working" actually means for you.

### WHEN TO PAUSE OR SKIP ENTIRELY

FOR RESEARCH AND EDUCATIONAL USE ONLY · NOT MEDICAL ADVICE

Many users report that they delay or avoid peptides if they are pregnant, breastfeeding, have a history of

CHAPTER

# 02

# Safety First.
## *A risk-reduction checklist you do not skip.*

- The pre-flight health and sourcing checklist
- How to evaluate a vendor in 60 seconds
- The Green / Yellow / Red stoplight framework

CHAPTER TWO

# Risk reduction, before anything else.

*Powerful tools deserve careful preparation.*

The fastest way to a bad outcome is to skip the prep. The fastest way to a good one is to spend an extra week reading labels, checking lab results, and writing down a few baseline measurements. The research community treats this groundwork as non-optional — and so should you.

**PRE-FLIGHT CHECKLIST**

- ✓ Review your medical history — heart, liver, kidney, oncology, autoimmune.
- ✓ List all current medications and supplements; some interact with peptides.
- ✓ Record baseline measurements: blood pressure, resting heart rate, sleep quality.
- ✓ Document a single goal and the metrics you'll watch.

## Source quality is everything.

Not every product sold online is what it claims to be. Look for vendors with transparent labeling, batch-level **third-party Certificates of Analysis (COA)**, visible customer service, and clean packaging. If a site looks improvised, the contents likely are too. Greenstone publishes a COA on every product for exactly this reason.

**GREENSTONE STANDARD**

Every Greenstone batch is independently tested for purity and identity by an accredited third-party laboratory. The COA travels with the product — not as a marketing badge, but as the receipt of what's inside. Research-grade purity. US-shipped. Third-party verified.

## The stoplight system.

In research settings, materials are handled with a simple decision rule: green keeps you moving, yellow makes you slow down, red ends the protocol. Apply the same logic to your own signals.

**GREEN**

All clear. Baseline data is steady, no new symptoms, source verified. Continue as

**YELLOW**

New or unusual symptoms, uncertainty about a reaction, or a sourcing question. Slow

**RED**

Allergic reaction, breathing difficulty, chest pain, fever, or any severe response. Stop

FOR RESEARCH AND EDUCATIONAL USE ONLY · NOT MEDICAL ADVICE

CHAPTER

# 03

# Pick the Right Peptide. *A decision framework that removes guesswork.*

- How to map a goal to a peptide family
- Why "stacking" is the wrong move on day one
- How research approaches think about starting points

CHAPTER THREE

# Goal first. Peptide second.

*The decision tree is shorter than you think.*

Most beginner mistakes come from working backwards — picking a popular peptide and then deciding what to use it for. Reverse the order. Start with the goal. Let the goal point you to a family of peptides. Then narrow from there based on evidence, side-effect profile, and personal context.

GOAL A

### Recovery & Repair

Faster recovery, reduced soreness, support around training or tissue repair.

Repair / recovery family · Tissue support family

GOAL B

### Performance & Body Comp

Metabolic support, appetite signaling, training output, sleep-driven recovery.

Metabolic family · Sleep & stress family

GOAL C

### Longevity & Skin

Skin signaling, collagen-related pathways, healthy-aging research approaches.

Skin family · Cognitive support family

## Three rules of thumb for beginners.

- **Pick one peptide** to start. Single variable, clean signal.
- **Favor compounds** with mature evidence and well-mapped side-effect profiles in the research record.
- **Match to lifestyle.** Some compounds are studied as oral preparations, others as injectables in research settings. Pick what your context can sustain.

RESEARCH NOTE · STARTING APPROACHES

Common research approaches involve starting at the lowest published study amount, observing for a defined window, and only adjusting if there is no signal and no adverse effects. **"Start low and go slow"** is a phrase you'll see repeatedly in the literature — it reflects how the research community thinks about variable isolation, not a personal recommendation.

## Personal context changes everything.

FOR RESEARCH AND EDUCATIONAL USE ONLY · NOT MEDICAL ADVICE

Age, training load, sleep consistency, and diet all influence how the body responds. Poor sleep or chronic stress can blunt the signal of even a well-chosen peptide. Track those supporting factors as you can

CHAPTER

# 04

# The First 72 Hours.
## *Set up clean. Stay steady. Build early momentum.*

- The Day 0 / Day 1 / Day 2 / Day 3 framework
- How to remove confounding variables
- The "safest response ladder" for early signals

CHAPTER FOUR

# The 72-hour protocol.

*Three days that set the tone for everything after.*

The first 72 hours are not about results. They are about **routine**. You're establishing a baseline, removing variables, and giving yourself a clean window to read signals. In research settings, materials are always handled in sterile conditions and on a fixed schedule — bring that same discipline to your own setup, even if the protocol you're following is purely educational.

HOUR 0 · DAY 0

### Get Ready

- Define your single goal
- Pick 1–3 metrics to track
- Prep supplies and logs
- Cut alcohol & late caffeine
- Set steady sleep / wake times

HOUR 24 · DAY 1–2

### Start & Build

- Record baseline data
- Follow the protocol on a fixed schedule
- Hold hydration & nutrition steady
- Don't change training load
- Log everything before/after

HOUR 72 · DAY 3

### Review

- Look for subtle signals
- Compare against baseline metrics
- Don't chase placebo
- Hold steady — no changes yet
- Plan the next 7–14 days

## The safest response ladder.

If you notice anything unexpected — minor irritation, off sleep, appetite shifts — research convention defaults to a simple three-step pause:

WHEN SOMETHING FEELS OFF

- ✓ **Pause and observe.** Don't continue until you're confident the signal isn't safety-related.
- ✓ **Review the checklist.** Was anything skipped? Source verified? Symptoms mild or escalating?
- ✓ **When in doubt, contact a medical professional.** A short call beats a long regret.

*— Steady beats fast. The first 72 hours are about giving the protocol a fair test, not winning a race.*

CHAPTER

# 05

# Track What Matters.
## *Turn "I think it's working" into measurable progress.*

- The five-metric tracking dashboard
- Why trends beat single-day data
- How to read your stoplight signals

CHAPTER FIVE

# Trends, not flashes.

*Tracking is how guesswork becomes evidence.*

Without data, every result is just a feeling. Feelings are unreliable on their own — good days get over-credited, bad days get over-blamed, and the quiet middle gets ignored. A simple tracker fixes all three problems and takes about 90 seconds a day.

## Your dashboard.

Keep it small. Five inputs is plenty.

THE FIVE-METRIC DASHBOARD

- ✓ **3 goal metrics** — sleep duration & quality, soreness, appetite, recovery, or skin signals.
- ✓ **2 safety metrics** — resting heart rate, blood pressure, or another easily-checked signal.
- ✓ Time of protocol (same window each day).
- ✓ Stress / training / sleep context for the day.
- ✓ Anything unusual — even minor.

## Daily journaling prompts.

- What time did you follow the protocol?
- What did you eat — and when?
- Did you train, travel, or have a high-stress day?
- Any unusual sensations or symptoms?

READ THE TREND, NOT THE TWEET

Peptides operate gradually in the research record. A single great day or single rough day means very little. Look for patterns that hold over five to seven days in a row before drawing conclusions. Many users report that their first honest "this is doing something" moment arrives in week two or three.

## How to adjust.

FOR RESEARCH AND EDUCATIONAL USE ONLY · NOT MEDICAL ADVICE

- **Green signals across the board?** Stay the course. Don't optimize what's working.

CHAPTER

# 06

# Make Results Stick. *A 30-day routine that compounds, not complicates.*

- The five pillars that magnify any peptide protocol
- How "habit stacking" turns motivation into routine
- When to cycle, reassess, or quietly stop

CHAPTER SIX

# The 30-day routine.

*Boring is the point. Boring compounds.*

After your first 72 hours, the question shifts from "is this working?" to "can I keep this clean for thirty days?" The answer almost always lives outside the peptide itself — in the support pillars that make any signaling molecule work harder. Many users report that the biggest gains came from the boring stuff they were resisting.

## Stack the protocol onto a habit you already have.

Anchor your protocol to something you already do every day — morning coffee, brushing teeth, stretching before bed. This is "habit stacking," and it's how routines survive busy weeks.

## The five support pillars.

BUILD THESE IN PARALLEL

- ✓ **Sleep.** Same bedtime, same wake. Most undervalued lever in the entire protocol.
- ✓ **Protein.** Most people need more than they think. Match it to your size and goal.
- ✓ **Resistance training.** Lift something heavy two to four times per week.
- ✓ **Stress management.** Walks, breathwork, quiet time — not optional.
- ✓ **Recovery.** Stretching, mobility, real rest days.

Don't try to install all five at once. Pick one, get consistent, then add the next.

## Cycling and reassessment.

Build review windows into the schedule — every three to four weeks, sit with your tracker and decide: continue, adjust, or step back. Avoid the *"stacking spiral"* — adding new compounds before the first one has been cleanly evaluated.

LONG-TERM SAFETY HABITS

Many users report that the highest-leverage long-term habit is consistent sourcing — staying with one verified vendor batch after batch. Greenstone's third-party COA travels with every order so the chain of custody never has to be guessed.

ACTION PLAN

# Your Next 3 Steps.

*A 30-minute setup, then three steady days.*

*01*

10 MINUTES

## Define your single 72-hour outcome.

Pick one goal — sleep, recovery, metabolic support, skin, or tissue repair. Write three goal metrics and two safety metrics next to it. That's your dashboard.

*02*

20 MINUTES

## Run the safety checklist.

Review your medical history and current medications. Set your green / yellow / red stoplight rules. If anything in your history is uncertain, schedule a quick call with a clinician before continuing.

*03*

3 DAYS

## Run the 72-hour consistency sprint.

Steady sleep and wake times. No alcohol. No late caffeine. Log your dashboard before and after. Don't change anything for three days. On day four, sit with the data — and make one decision based on the trend.

*"Clarity beats complexity. Safe progress is the fastest progress."*
